Getting Started

First Steps

Download

Last updated: 2021-02-07T14:00:58.000Z | [Online Version](#)

There are two ways to download the software installer:

1. The 72-hour temporary link in the activation email received after your online purchase
2. In these articles, available after signing in
 - [Forensic Studio](#)
 - [Forensic](#)
 - [Spotlight](#)

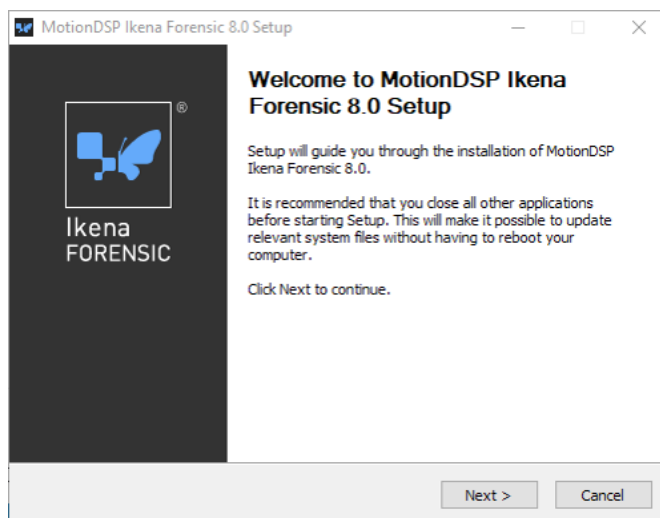

Note: Legacy Installers can be found [here](#)

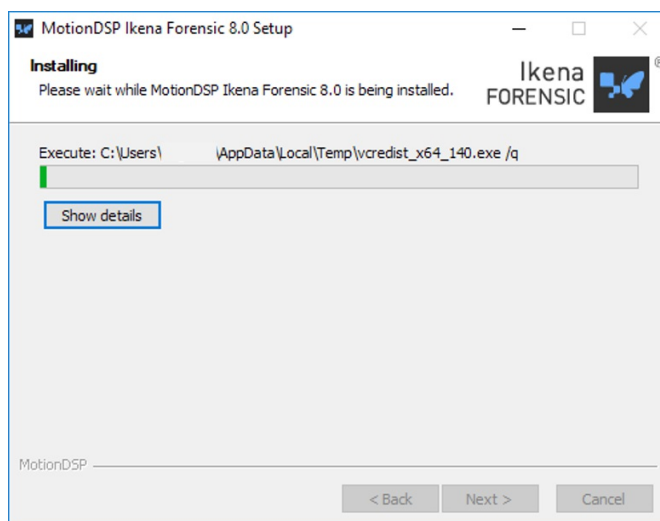

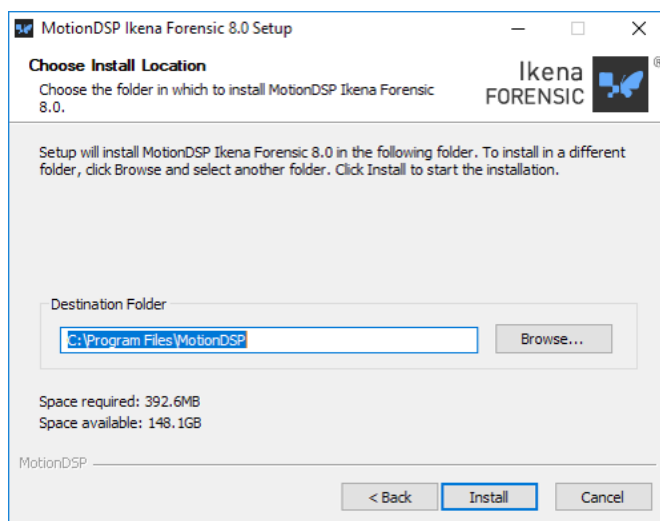

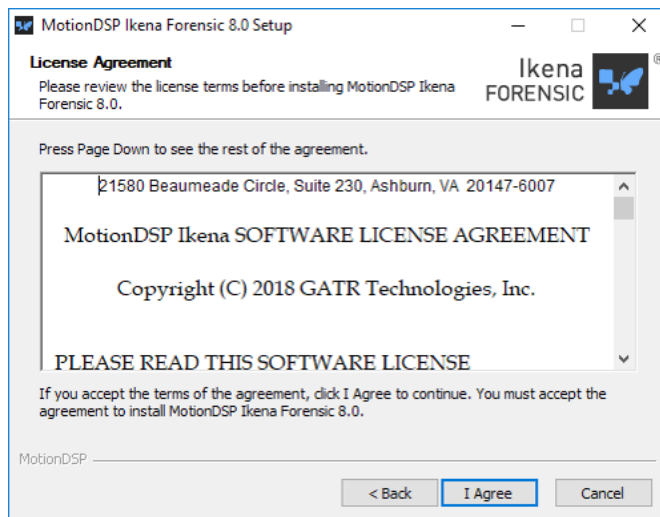

Install

Last updated: 2021-08-29T02:05:27.000Z | [Online Version](#)

After downloading the software, launch the .exe file and navigate through the installer prompts.

If you have installed versions of the software on the computer, please follow the prompt to uninstall previous versions prior to updating.

Install LAV Filters

Last updated: 2021-01-28T17:18:40.000Z | [Online Version](#)

[Download LAV Filters](#)

In order to play video and audio, you need software which is able to translate the file into a format your computer can understand.

LAV Filters are a set of open-source DirectShow filters that does this translation for all the popular video and audio formats:

- **LAV Splitter**: a source/splitter filter required to demux video files into their separate elementary streams.
- **LAV Audio** and **Video Decoder**: powerful audio and video decoders with a focus on quality and performance.

You can find the latest version of the LAV Filters available [here](#).

Activate

Last updated: 2021-08-10T00:36:21.000Z | [Online Version](#)

There are two ways to activate your subscription:

1. In-App - The application will ask for a product key or V2C file upon launch when no valid license is available.

o

2. [Offline Activation](#) - If you are activating a computer behind a restrictive firewall or with no network access you can use your product key and the self-service portal available at <https://activate.motiondsp.com>

Basic Functionality

Keyboard Shortcuts

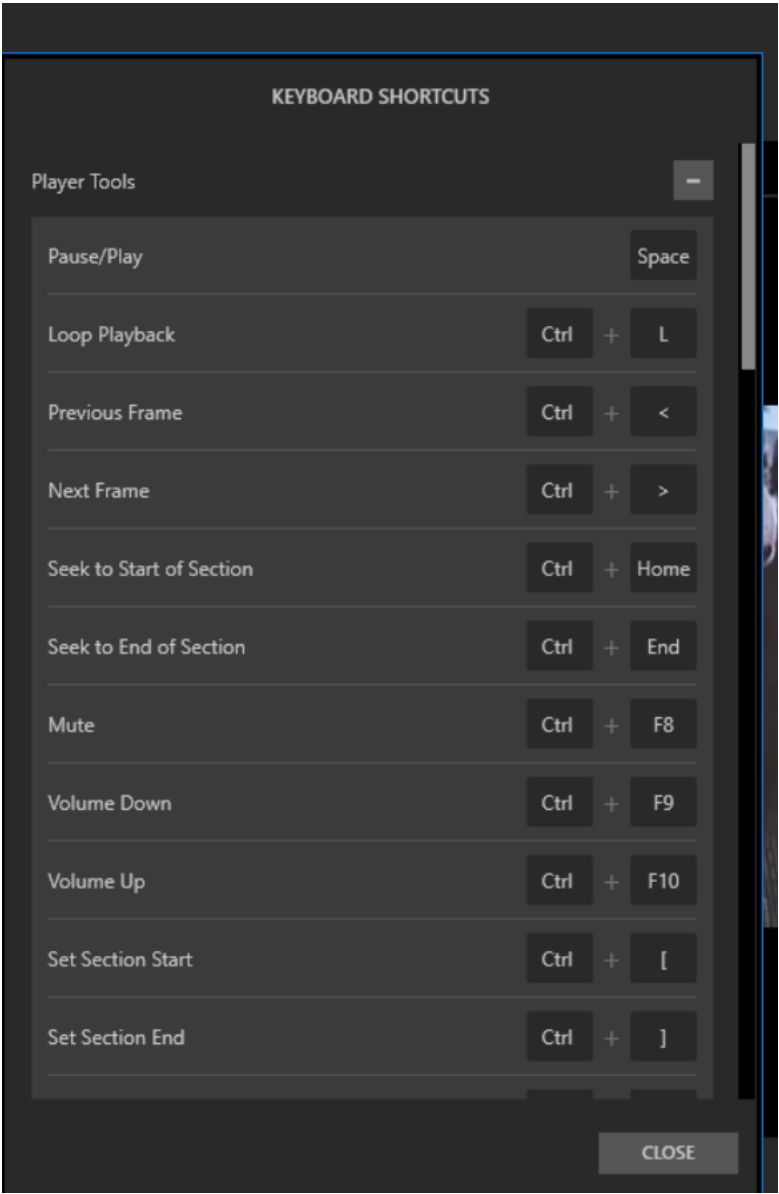

Last updated: 2021-06-17T15:16:34.000Z | [Online Version](#)

There are keyboard shortcuts that allow you to navigate the software settings without using your mouse. Located under the HELP tab, select Keyboard Shortcuts. Use the side bar to scroll down for more shortcuts.

Click on links below for full PDF 9.0 versions

[Forensic Studio-Forensic Keyboard Shortcuts](#)

[Spotlight Keyboard Shortcuts](#)

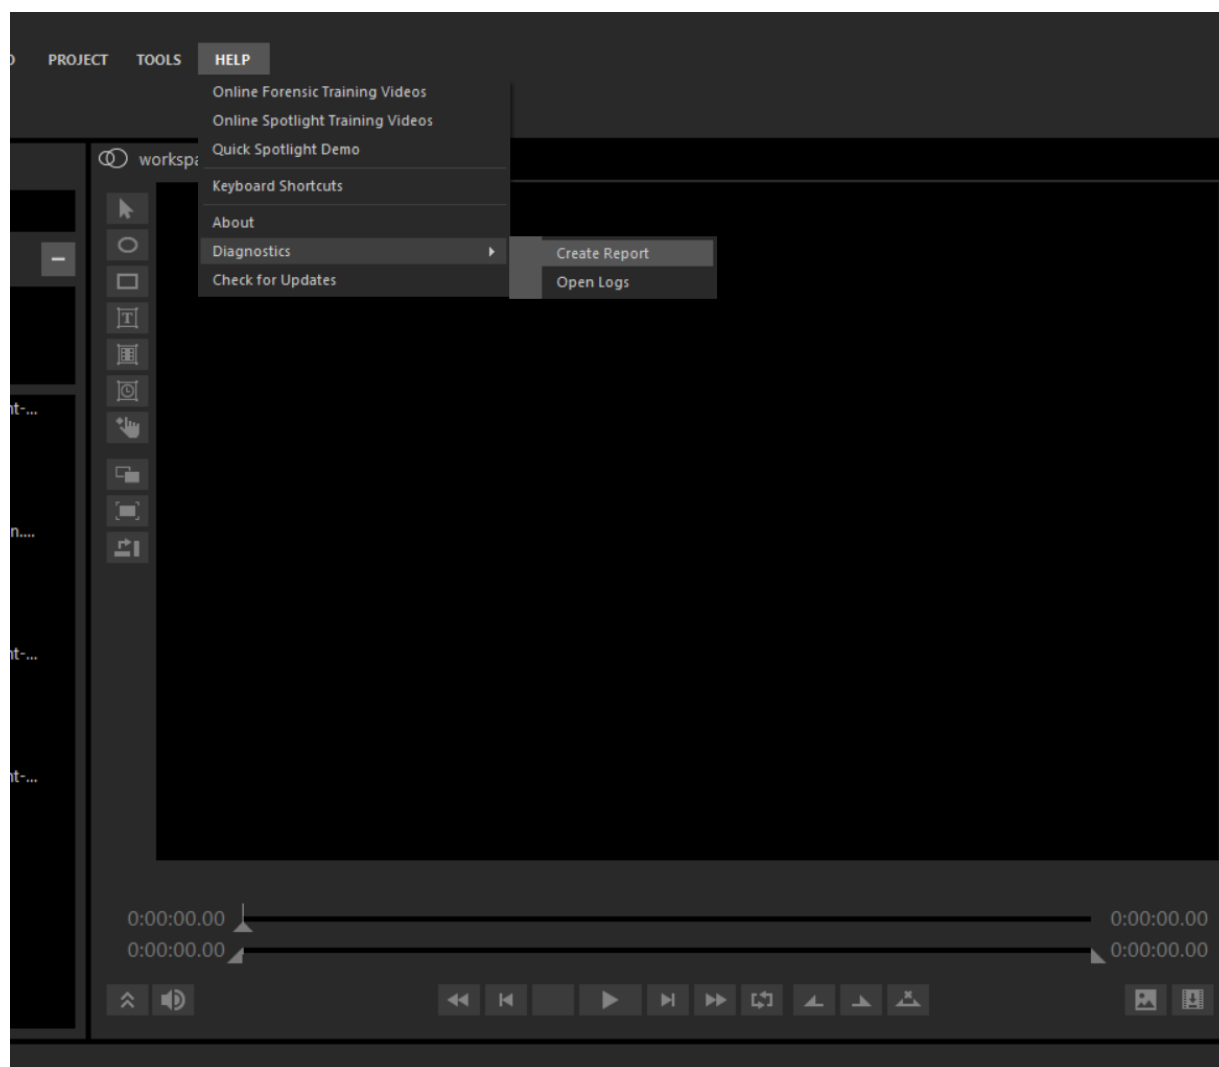

How do I generate a Diagnostic Report?

Last updated: 2021-01-28T17:19:37.000Z | [Online Version](#)

Crash reports should be generated automatically on newer versions but if needed, here are the instructions:

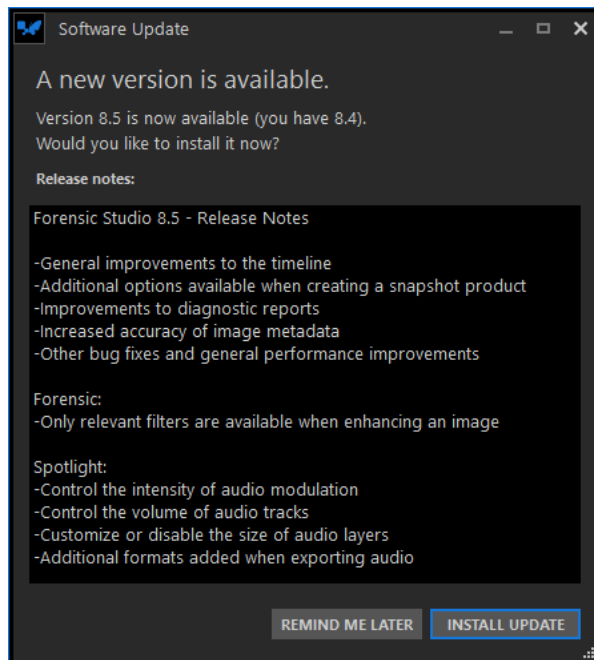

Navigate to Help, click on Diagnostics, and click Create Report

Automatic Software Updates

Last updated: 2021-01-28T17:20:24.000Z | [Online Version](#)

All applications come equipped with an Automatic Software Updater that appears upon start-up when a newer version of the application is available. A sample of the Forensic Studio software update window is pictured below.

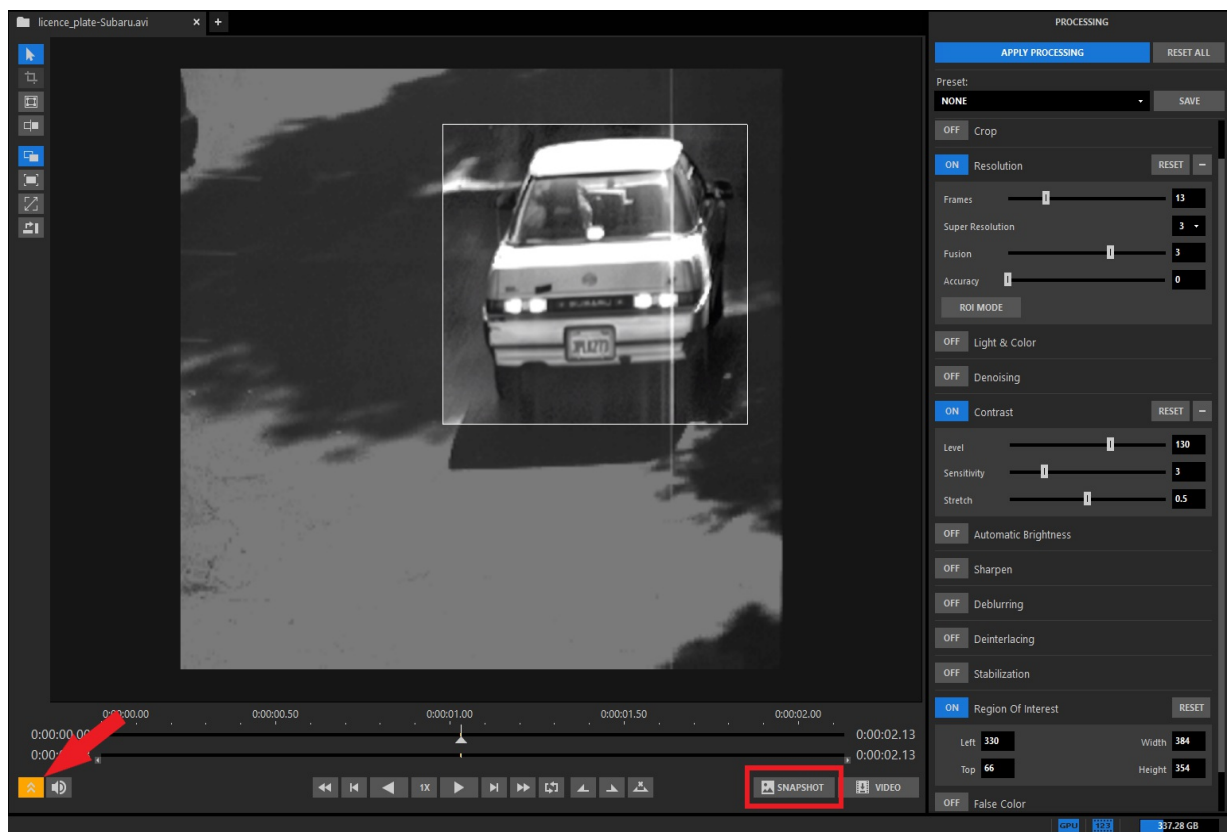

You can launch the Software Update feature manually by selecting *Check for Updates* under the Help menu of your application.

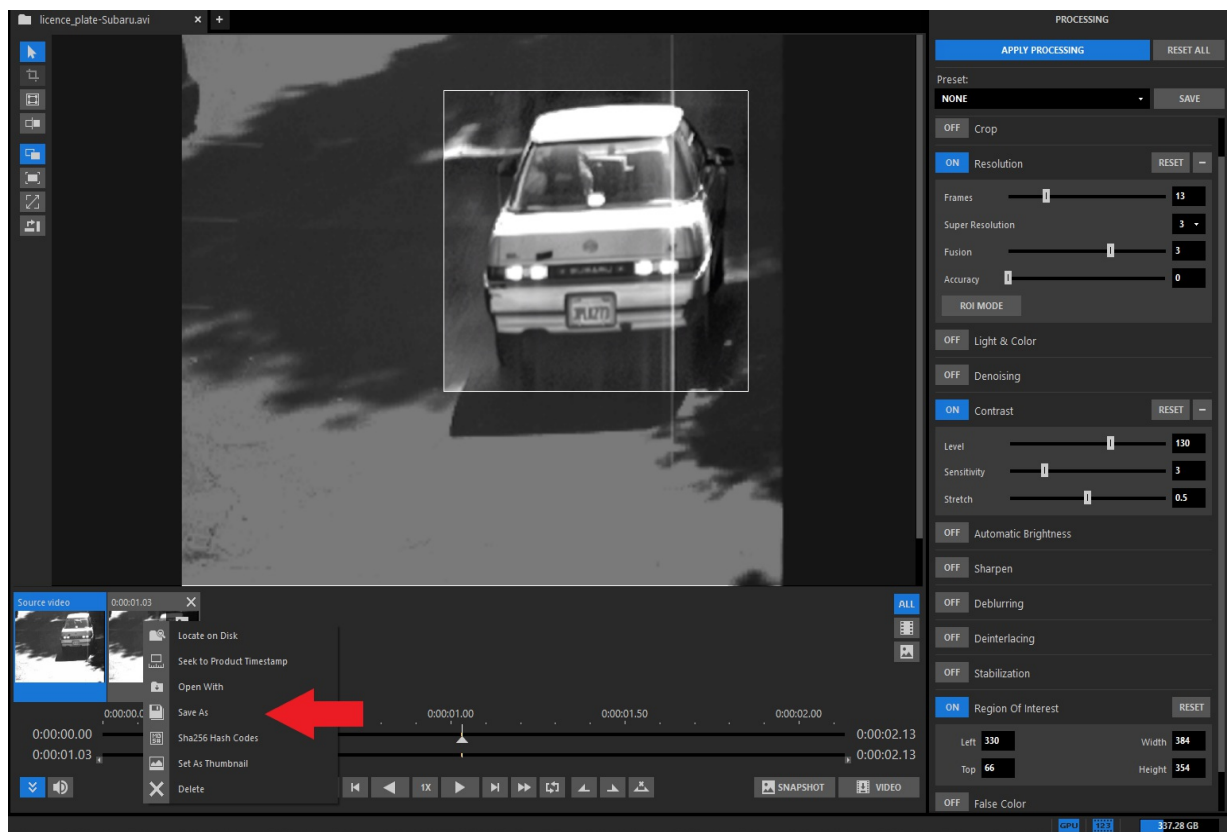

Generating a Snapshot

Last updated: 2021-01-28T17:20:39.000Z | [Online Version](#)

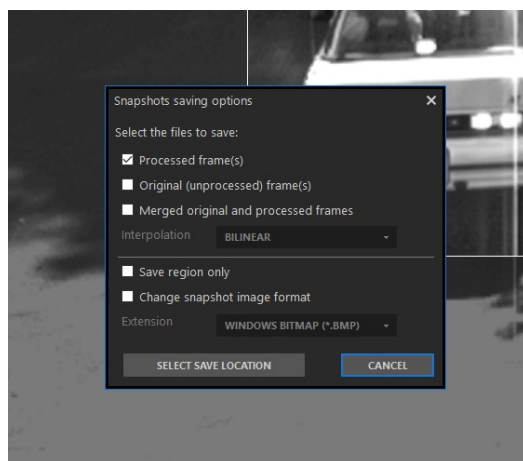

Snapshots are still image products you can generate in all MotionDSP applications. To create a snapshot click on the Snapshot button in the lower-right corner of the player. If your Product List is closed, you'll notice the product list icon will change color indicating a new product has been created.

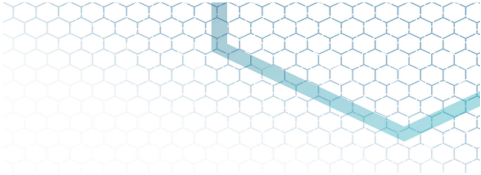

Right-click on this new product and select Save As

Saving Snapshots has the following options

- 
1. Processed frame(s)
 - This will save a copy of your snapshot with processing applied. *_enhanced* will be appended to the filename
 2. Original (unprocessed) frame(s)
 - This will save a copy of your snapshot without processing applied. *_original* will be appended to the filename
 3. Merged original and processed frames
 - This will save a copy of both the processed and unprocessed products side by side in one file. *_merged* will be appended to the filename
 4. Interpolation
 - Choose the interpolation method for creating a merged product
 5. Save Region Only
 - When working with the Region of Interest tool in Forensic Studio or Forensic, selecting this option will save only the area within the defined region
 6. Change snapshot image format
 - Options include: BMP, PNG, JPG, TIFF
-

GPU Support

Last updated: 2021-01-28T17:20:55.000Z | [Online Version](#)

To enable real-time processing of video, our suite of applications have been optimized to leverage the additional processing power available in modern GPUs using NVIDIA's CUDA technology.

GPU-Accelerated Processing

-Offload filter processing and tracking to GPU resources

GPU-Accelerated Encoding

-Export H.264 video faster with GPU resources

TIPS:

- MotionDSP applications only support NVIDIA GPUs with a minimum CUDA compute capability of 3.0 or higher.
- You can specify which GPU to use for which workload in the GPU options menu if more than one GPU is installed on your system.

Play Controls

Last updated: 2021-01-28T17:21:15.000Z | [Online Version](#)

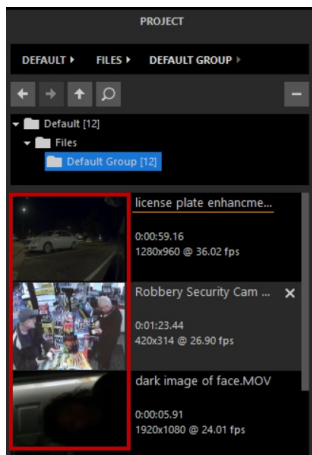

1. Start of Section/Video	Return the playhead to the beginning of the video or defined section (Ctrl+Home)
2. Previous Frame	Move back one frame (Ctrl+<)
3. Reverse Playback (not available in Spotlight)	Reverse playback at the set playback speed (Backspace)
4. Playback Speed	Options are: 1/8*, 1/4, 1/2, 1x, 2x, 4x <small>*Not available for export</small>
5. Play/Pause	Forward playback and pause (Space)
6. Next Frame	Move forward one frame (Ctrl+>)
7. End of Section/Video	Move the playhead to the end of the video or defined section (Ctrl+End)
8. Loop	Enable looping for the video or section (Ctrl+L)
9. Set Section Start	Begin section at playhead (Ctrl+[)
10. Set Section End	End section at playhead (Ctrl+])
11. Reset Section	Clear established section start and end points (Ctrl+\)

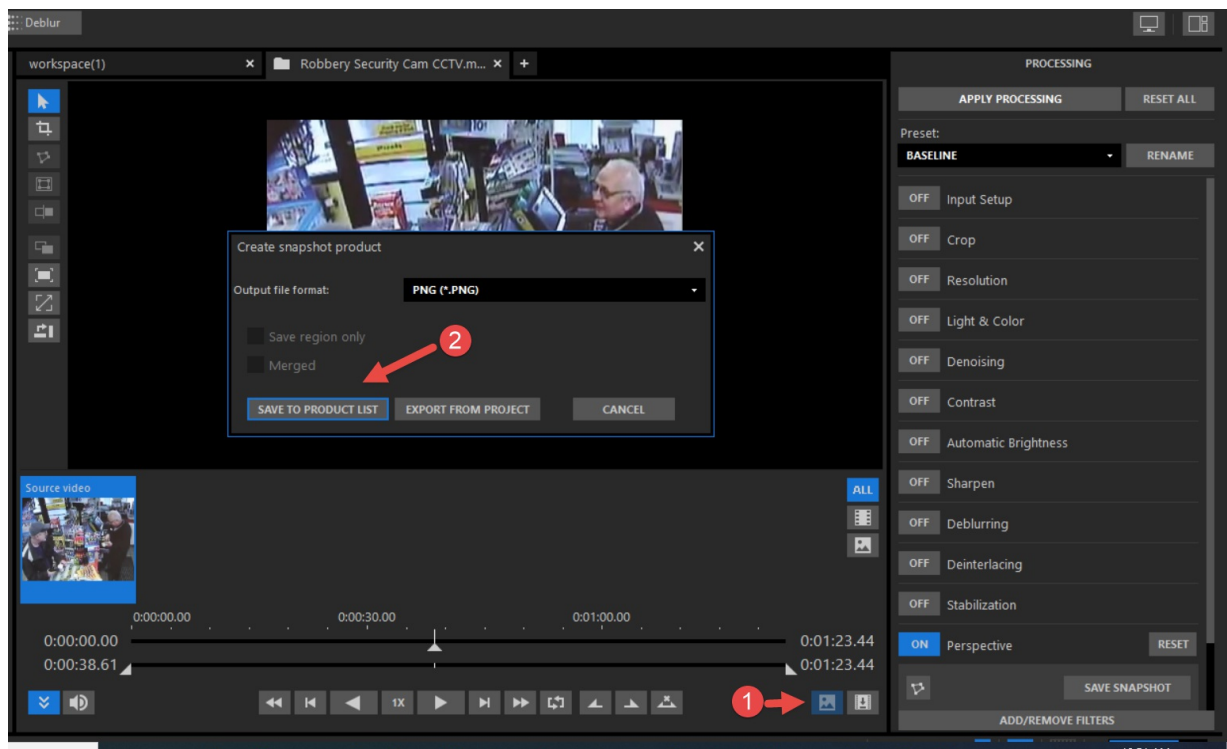

Set as Thumbnail feature

Last updated: 2020-12-10T17:44:30.000Z | [Online Version](#)

A thumbnail is a small representation of an image that is used to identify a file by its contents intended to make it faster to manage a group of larger images.

To create a thumbnail, create a snapshot of the image you would like to be displayed as the thumbnail and click "save to product list".

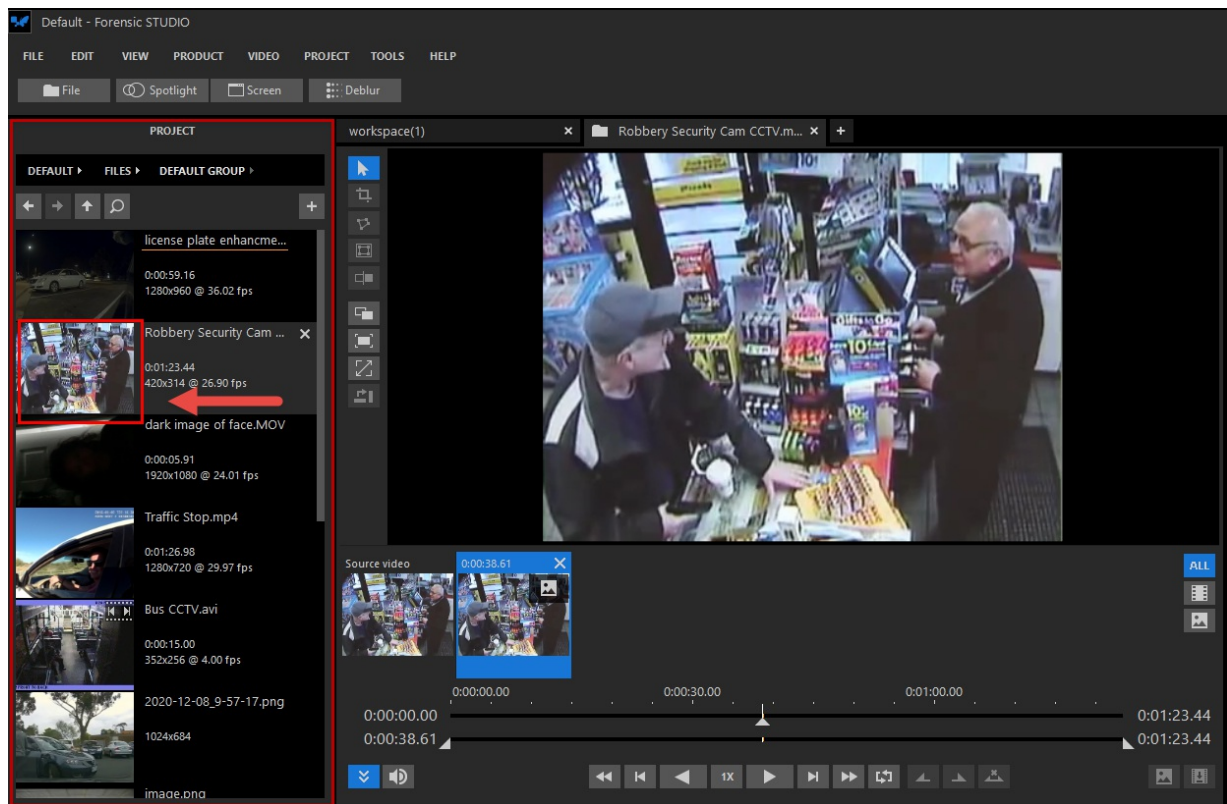

The image will display in the Product list section as seen below:

Right click on the desired snapshot and choose Set as Thumbnail

Your updated thumbnail will be displayed in the Project Panel.

Timeline Navigator

Last updated: 2021-01-28T17:21:29.000Z | [Online Version](#)

Some videos have a long duration that makes representing their timing on the Timeline too small. This can reduce precision when trying to select another frame or scrub through a smaller section.

The example above shows the entire 11-minute video

By dragging the Timeline Navigator handles inward the same video now only displays 4 minutes of video (minutes 4:00 - 8:00)

TIPS:

- The zoomed section will move forward with the playhead as it reaches the end of the zoomed area but will retain its zoom duration.

Trim Section

Last updated: 2021-01-28T17:21:54.000Z | [Online Version](#)

Not every part of a video is as important as others. Sometimes you'd like to reduce the amount of a video that can be worked with and exported.

In the above example, the 11-minute video has been reduced to a working range from 4:00 - 6:00 using the [Set Section In](#) and [Set Section Out](#) buttons and is defined by the blue bar.

TIPS:

- The playhead can't leave the section when one is set.
- When loop is enabled only the section is looped.
- When a section is set, only that section will be exported

Projects

Last updated: 2021-01-28T17:22:08.000Z | [Online Version](#)

When you launch a MotionDSP application, you will be prompted to either create a new project or to open an existing project. Projects can include one or more pieces of original video material (files) screen captured video and all enhanced snapshots and videos.

Every change you make to the settings (e.g., enhancements) is saved in the project and will be apparent the next time you open the project. Projects can be saved manually by selecting the Save Project and Save (Export) Project As menu options in the File menu. Projects are saved automatically on every change and after a user finishes working with that Project (by selecting New Project, Open Project or Exit from the File menu).

The default location for all MotionDSP projects is a folder in your default videos folder (e.g., My Videos) in Windows. Project files have an ".IPROJ" extension.

Importing files

Last updated: 2021-01-28T17:23:15.000Z | [Online Version](#)

To import an audio or video file from a local or networked drive, select File>Import Video> File, or press the File button in the main toolbar, or drag-and-drop a video file into the Project Pane.

Saving a product

Last updated: 2021-01-28T17:22:55.000Z | [Online Version](#)

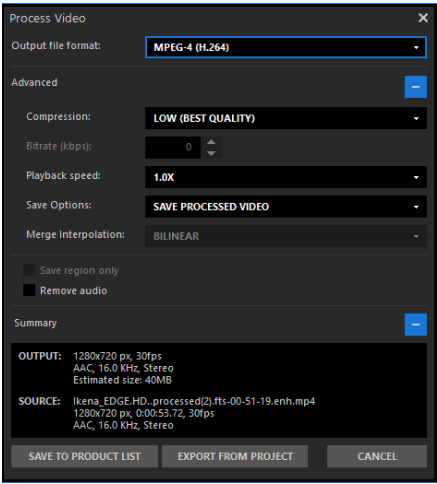

There are two ways to save a product once you have finished enhancing or redacting.

First click on the VIDEO button:

Then you will be presented with two options SAVE TO PRODUCT LIST or EXPORT FROM PROJECT:

Save to Product List - This will create a product that will appear in your product list and remain in the project's folder

Export from Project - This will create a product outside of the project folder in a folder you define in the options menu. This product will also appear in the product list as well as the project folder

	<u>Video:</u>
	-Uncompressed AVI
	-Compressed AVI
	-WMV
	-H.264 MP4
Output File Format	-H.265 MP4*
	<u>Audio:</u>
	-MP3
	-WMA
	-AAC
	-WAV
Compression†	-Determine video codec compression settings
	<i>Not available when Output File Format set to Uncompressed AVI</i>
Bitrate†	-Set the exported video bitrate manually
	<i>Only available for H.264 MP4 with 'Custom' Compression settings</i>

Playback Speed†	-Adjust the exported video playback speed -1/4x, 1/2x, 1x, 2x, 4x
Save Options†	-Save Original (Save the video with no Forensic or Spotlight changes) -Save Processed Video (Save the video with Forensic or Spotlight changes) -Save Merged Video (Save a video with the original and processed version side-by-side) -Save Both Processed and Merged (Save two videos: 1 Merged, 1 Processed - as described above)
Merge Interpolation†	-Bilinear is the recommended format for getting the best quality for most videos. -Nearest neighbor is a format widely used by rendering engines.
Save Region Only†	-Save only the area inside the Region of Interest <i>Forensic Only</i>
Remove Audio†	-Checkbox to completely remove all audio layers from exported video
Summary	-Information about the video to be exported

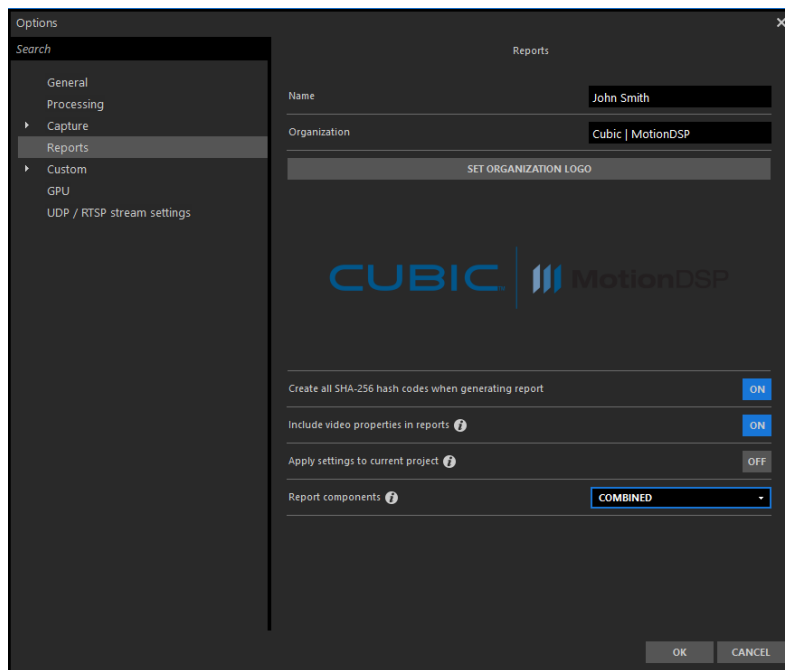

*Only available with GPU

†Only available when exporting a video product

Generate a Report

Last updated: 2021-01-28T17:22:40.000Z | [Online Version](#)

If this is your first time generating a report please take the time to configure your report preferences in the Tools>Options>Reports menu:

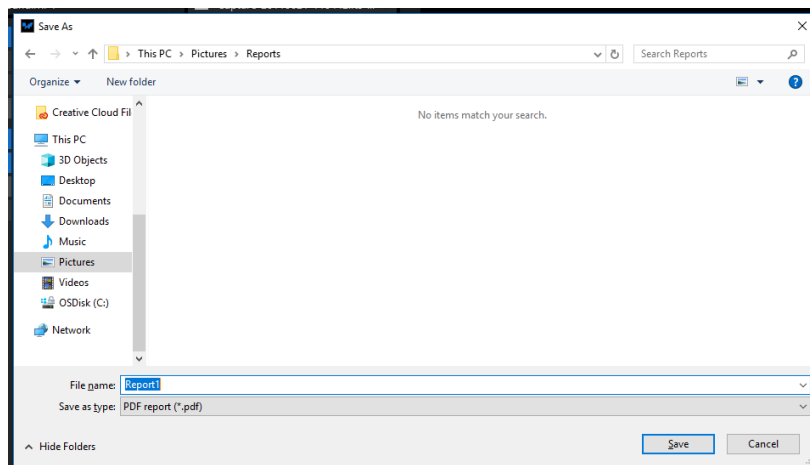

In order to generate a report, you must have two things

1. An original media file in the project panel
2. A Snapshot, Video, or Audio Product saved to the product list for the above media file.

Navigate to Tools>Generate Report (Current Video) and select.

Choose a save location, filename, and file type (PDF, RTF, XML) then save.

ScreenGrabber

Last updated: 2021-01-28T17:22:24.000Z | [Online Version](#)

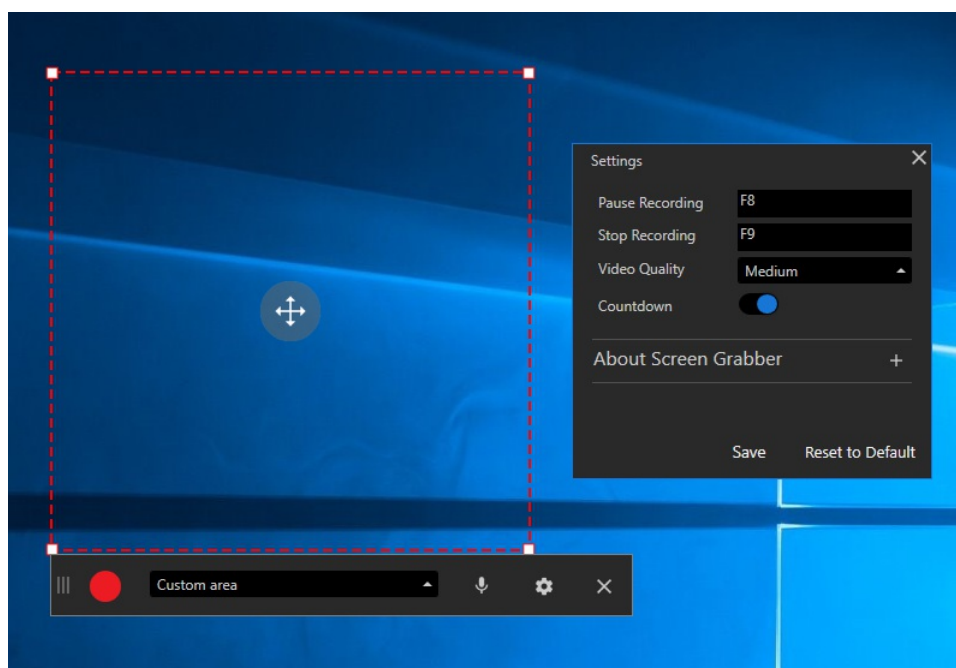

The ScreenGrabber application can record portions of the visible screen to a video file that can be processed by a MotionDSP application. It is commonly used to import CCTV footage from proprietary formats by playing the videos in specialized players and capturing the output.

The ScreenGrabber is installed in the MotionDSP application and can be invoked by the application or as a stand-alone application.

To start the ScreenGrabber as a stand-alone application click the Screen button at the top left corner under the menu.

ScreenGrabber has a very simplistic menu. Before starting a capture, a user can configure the ScreenGrabber settings by selecting the cog. Drag the corners around the video player or choose a common resolution and press record.

When your recording has finished press F9 and the video preview window will appear.

Review for accuracy then press the checkmark and select to 'Open in Application' or 'Save As' and choose a save location

FAQ

How do I upgrade to a different MotionDSP product?

Last updated: 2021-01-28T17:44:02.000Z | [Online Version](#)

Our Sales Team will assist you with your request at Sales@MotionDSP.com

I have not received my Product Key and Download

Last updated: 2021-01-28T17:43:30.000Z | [Online Version](#)

Your product key and download link should have been sent to you automatically. Please verify in your Spam and Junk folders for email containing Download of software and product key from Support@motiondsp.com. If you still cannot find it, please reach out to support by emailing support@motiondsp.com and we will promptly resend your email.

How do I add a Watermark?

Last updated: 2021-01-28T17:41:10.000Z | [Online Version](#)

Navigate to Tools, Options, Customs. Turn ON **Enable Watermark**.

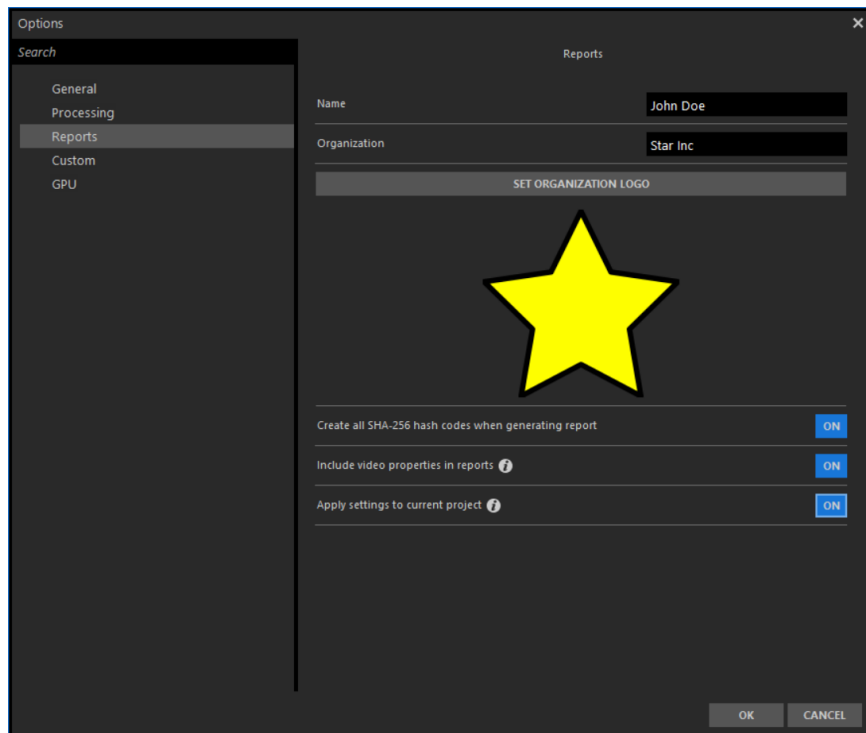

Adjust Watermark Transparency [%]. No watermark will be visible if watermark transparency is set as 100%. As watermark transparency % decreases, the more visible the watermark will be.

How do I add a Logo on reports?

Last updated: 2021-01-28T17:41:00.000Z | [Online Version](#)

Navigate to Tools\Options\Reports. Enter Organization, select Set Organization Logo, upload logo, and turn ON **Apply settings to current project**

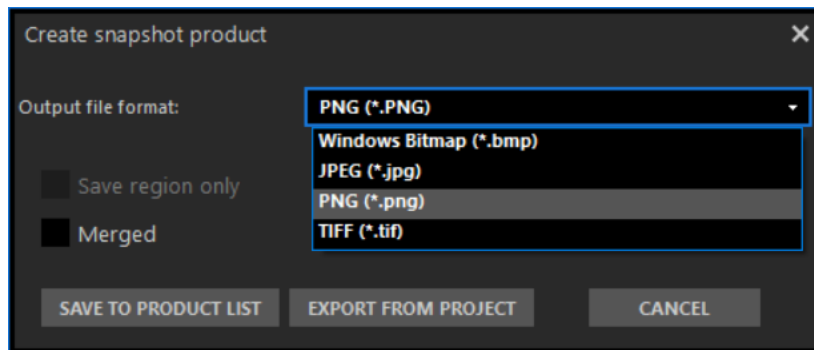

What file formats are supported?

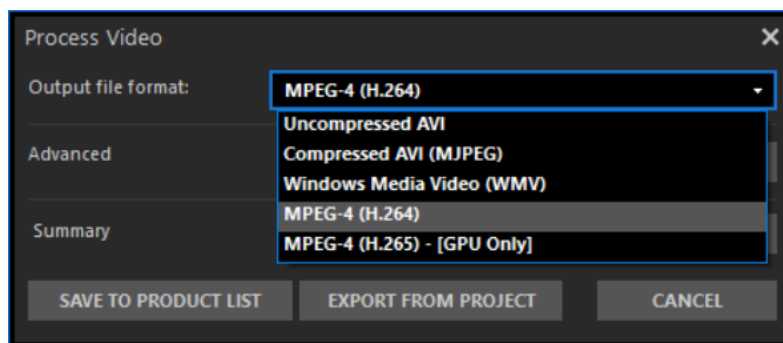

Last updated: 2021-01-28T17:53:49.000Z | [Online Version](#)

The following formats are supported by our software types:

Snapshots

Videos

How does my subscription work?

Last updated: 2021-01-28T17:54:09.000Z | [Online Version](#)

You may learn more about the different subscriptions we have available and see which suits you best.

[Subscription & Cancellation Policy](#)

I receive an error when attempting to activate my product.

Last updated: 2021-01-28T17:27:43.000Z | [Online Version](#)

Automatic activation utilizes certain network ports and protocols that might be blocked under more restrictive networks or completely unavailable on a computer not connected to the internet. If you experience either of these situations attempt an [Offline Activation](#) on a computer with unrestricted internet access.

Why can't I import my file?

Last updated: 2021-01-28T17:27:18.000Z | [Online Version](#)

Forensic, Spotlight, and Forensic Studio have native support for a number of video and audio formats and codecs. We also heavily leverage the [LAV Filters](#) codec pack to expand our capabilities further.

If you are trying to import audio or video in a proprietary codec you will need to contact the manufacturer for access to the codec. In cases where the codec is not available, use [ScreenGrabber](#).

Spotlight requires the [LAV Filters open-source codec pack](#) that can play most commonly-available video files.

NOTE:

- Using other third-party codecs may degrade results.
- If you choose not to install the codec pack, a typical Windows machine will only be able to open a small range of video files, for example, MPEG2 and H264 video files, and Windows Media (WMV)

Announcements

Cubic | MotionDSP Beta Test Program

Last updated: 2021-01-28T17:38:08.000Z | [Online Version](#)

We are excited to extend an invitation to our new Beta Program. The purpose of the Beta Program is to enable us to develop and deliver the highest quality applications with the features you need. The program begins with an early preview of new Forensic and Spotlight features not yet available to the public. Participation in the Beta Program is voluntary, however, feedback and input resulting from your early access will be invaluable to the ongoing development of features that really matter to users like yourself.

Participants will be asked to complete 2 short, electronic surveys delivered over 60 days, plus attend at least one 30 minute focus group discussion or 1-on-1 call so that we can best understand your needs, requirements, and experience resulting from the early release.

If you're interested in joining the Beta Program, [sign up here](#) and a Customer Service Representative will be in touch to provide access to the latest software download and more details about the program.

Troubleshooting

Application

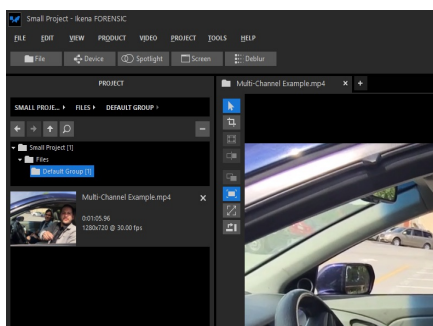

Why can't I open Deblur?

Last updated: 2021-01-28T17:27:55.000Z | [Online Version](#)

In order to launch Deblur there must be a file for it to open. Select a video from the project pane to open it in the Workspace, after which you can select the Deblur button.

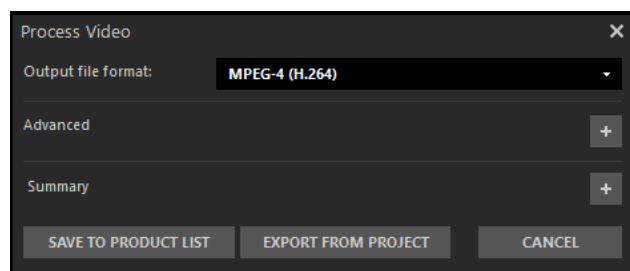

No Video Loaded - Deblur Unavailable

Video Loaded - Deblur Available

What's the difference between exporting and saving to product list?

Last updated: 2021-01-28T17:38:47.000Z | [Online Version](#)

Save to Product List - This will create a product that will appear in your product list and remain in the project's folder

Export from Project - This will create a product outside of the project folder in a folder you define in the options menu. This product will also appear in the product list as well as the project folder

I've applied filters but don't see any changes

Last updated: 2021-01-28T17:27:00.000Z | [Online Version](#)

1. Make sure the Apply Processing button above the filters is turned on. (Blue)

o

Processing On

Processing Off

2. Choose the Compare/Switch tool to see Before/After processing side-by-side

o

3. Use your scroll wheel to zoom in on the image, some changes are subtle

Why can't I open Spotlight in Forensic Studio?

Last updated: 2021-01-28T17:28:03.000Z | [Online Version](#)

In order to launch Spotlight there must be a video for it to open. Select a video from the project pane to open it in the Workspace, after which you can select the Spotlight button.

No Video Loaded - Spotlight Unavailable

Video Loaded - Spotlight Available

Why is Super-Resolution limited to 2 or 3?

Last updated: 2021-01-28T17:38:17.000Z | [Online Version](#)

Super-Resolution can only generate products as large as the available export size. For this reason, you will see the Super-Resolution options reduced to 2 or 3 for video with a resolution larger than 1280 x 720

Video & Audio

Why can't I import my video/audio?

Last updated: 2021-08-01T17:26:22.000Z | [Online Version](#)

Forensic, Spotlight, and Forensic Studio have native support for a number of video and audio formats and codecs. We also heavily leverage the [LAV Filters](#) codec pack to expand our capabilities further.

If you are trying to import audio or video in a proprietary codec you will need to contact the manufacturer for access to the codec. In cases where the codec is not available, use [ScreenGrabber](#).

What's the difference between a container and a codec?

Last updated: 2021-01-28T17:42:42.000Z | [Online Version](#)

A codec is a way to code (encode) and decode digital data such as a video file. It compresses the stream to reduce file size before it is transmitted to make the video playable on devices.

The container defines the structure and content of the file which can audio or video. Some containers are limited to audio, photo or video only, or combination of audio and video.

License

What is a Hardware license?

Last updated: 2021-06-21T14:55:58.000Z | [Online Version](#)

Hardware dongles are only available to annual and multi-year subscribers. We do not provide this option for monthly subscribers.

The Sentinel hardware dongle already contains an activated license which is encrypted, so you will not see any files on the dongle. It is "Plug and Play", so you will not be prompted for activation. Insert the dongle in the USB port and launch the software.

If you do not see a red light displayed on the USB dongle, try a different USB port or update the driver so that your computer can successfully communicate with the dongle.

Since the dongle contains an activated license, please keep the dongle in a safe place. There is a nominal fee of \$250 per dongle for a replacement.

What is a Software License

Last updated: 2021-06-21T14:56:15.000Z | [Online Version](#)

Software License is available to monthly, annual, and multi-year subscribers.

You should receive a download install and product key via email. Please check your junk/spam folder and ensure that your email address is correct.

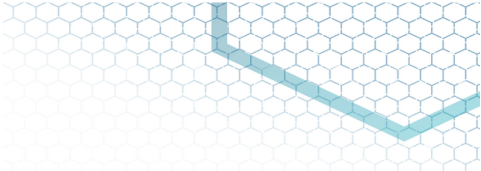

Your product key is good for one redemption of a software license using the automatic activation on the first launch of your application or using the [Offline Activation](#).

After activation, the software license is tied to the hardware on which you activated it. If your application becomes inactivated, you can reactivate the same hardware using your original [V2C file](#).

If you need to move your license to another computer, use the [rehosting instructions](#).

Please take care when redeeming or making changes to your application workstation. Refunds or replacements will not be provided for lost or misplaced licenses.

For more information about licenses on your workstation, use the [Sentinel Admin Control Center](#).

[Click here for steps to re-host license](#)

Admin Control Center Help

Welcome to the Admin Control Center. This application enables you to manage access to software licenses and Features, to control detachable licenses, to control sessions, and to diagnose problems.

Note: You can select the language in which Admin Control Center is displayed from the bottom of the **Options** pane.

The Admin Control Center enables you to monitor the following:

- All the Sentinel protection keys that are currently available on the network server, including their identity, type, and location
- The number of users currently logged in to a protection key, and the maximum number of users allowed to be simultaneously logged into that specific key
- The Features to which each protection key allows access, and any restrictions that apply to the Feature
- The users who are currently logged into a specific protection key, including detailed login information

Note: SL UserMode keys are only displayed for the local (Windows) machine. SL UserMode keys are not displayed when the `configuration` parameter **Do Not Load hasplmv.exe** is selected.

You can perform actions, such as:

- Detaching a license from the network and attaching it to your machine or a different recipient machine
- Cancelling a detachable license prematurely
- Installing an update to a license on a key that is visible in Admin Control Center

You can make basic configuration changes, including:

- Setting the display refresh time
- Configuring access permissions from a client machine to a remote server, and configuring a server to allow it to be remotely accessed
- Defining values for Products with detachable licenses

The Diagnostics page enables you to view system information related to the current Sentinel License Manager, and to generate reports.

Understanding the Software License

Last updated: 2021-01-28T17:40:00.000Z | [Online Version](#)

Your product key is good for one redemption of a software license using the automatic activation on the first launch of your application or using the [Offline Activation](#).

After activation, the software license is tied to the hardware on which you activated it. If your application becomes inactivated, you can reactivate the same hardware using your original [V2C file](#).

If you need to move your license to another computer, use the [rehosting instructions](#).

Please take care when redeeming or making changes to your application workstation. Refunds or replacements will not be provided for lost or misplaced licenses.

For more information about licenses on your workstation, use the [Sentinel Admin Control Center](#).

Offline Activation

Last updated: 2021-05-25T13:37:37.000Z | [Online Version](#)

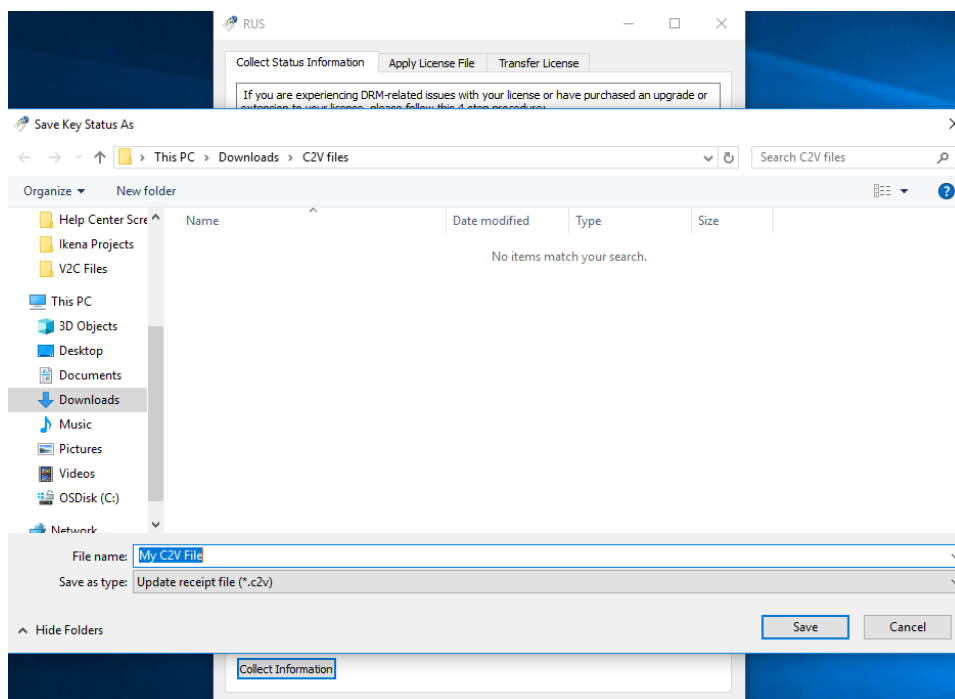

If you are unable to automatically activate your product using a product key at the application launch use the following, with [Application Workstation \(AW\)](#) being the computer with MotionDSP software installed, and [Network Workstation \(NW\)](#) being the computer with internet access.

If your workstation has internet access and can reach <https://activate.motiondsp.com>, ignore the [AW](#), [NW](#) markings and perform all steps on the singular workstation.

- [\(AW\)](#) Open the License Manager application, available in the MotionDSP Start Menu Folder, and choose the 'Installation of a new protection key' under the Collect Status Information tab.

- (AW) Choose a filename and save location (like a flash drive) that you can transfer to the **Network Workstation (NW)**

- (NW) Navigate to <https://activate.motiondsp.com> and enter a product key.

Rehosting a Software License

Last updated: 2021-01-28T17:38:25.000Z | [Online Version](#)

You can use the License Manager application (C:\Program Files\MotionDSP\PRODUCTNAME) to transfer your license from one computer, the **Source Computer (SC)** to another, the **Recipient Computer (RC)**. This procedure uses the License Manager on both computers so you will need to install your MotionDSP Product on the **Recipient Computer** before beginning. You can find your applicable [MotionDSP Installer here](#).

- (RC) Open the License Manager application and follow Step 1 on the Transfer License tab

RUS

Collect Status Information Apply License File **Transfer License**

To transfer (rehost) a license from one computer to another, you run the RUS program on both computers. On each computer, select the **Transfer License** tab and perform the appropriate step.

Collect information about the recipient computer

Step 1: On the computer to which you want to transfer the license (the "recipient computer"), collect and save information about the computer.

Save recipient information to rs\ Downloads\Rehost Files\Recipient File.id ...

2 → Collect and Save Information

Generate the license transfer file

Step 2: On the computer that currently contains the license (the "source computer"), select the license to transfer, read the recipient information file and generate a license transfer file.

Key Type	Key ID	Products
----------	--------	----------

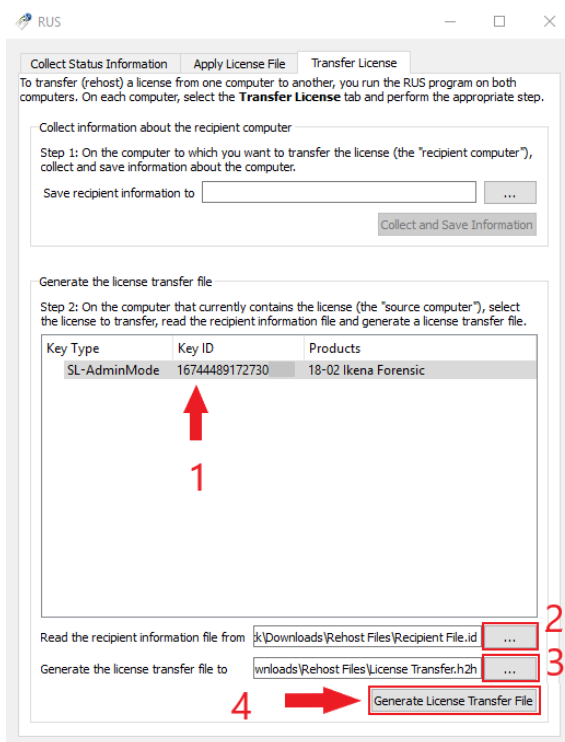

Read the recipient information file from ...

Generate the license transfer file to ...

Generate License Transfer File

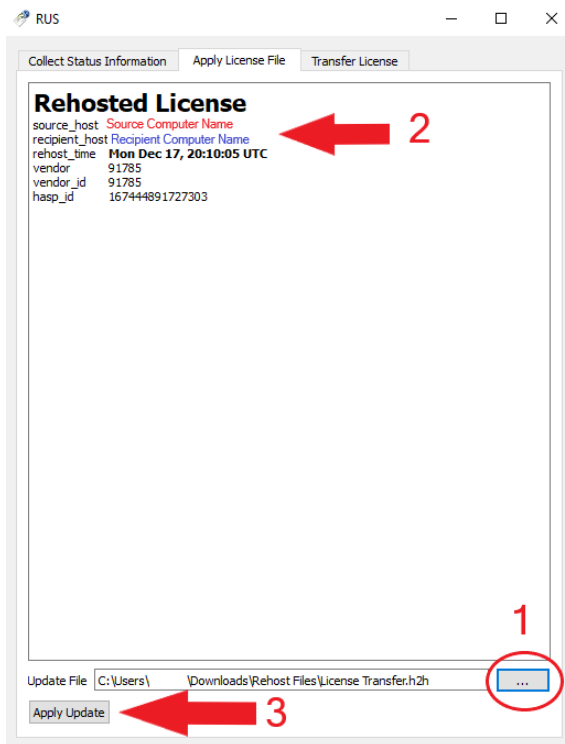

- (SC) Transfer the Recipient Computer .id file to the Source Computer and launch the License Manager

o

- o 1. Select the license you'd like to transfer
- o 2. Attach the .id file you created on the Recipient Computer
- o 3. Select a location to create the .h2h license transfer file
- o 4. Select Generate License Transfer File

- (RC) Transfer the .h2h file to the [Recipient Computer](#) and attach using the second tab of the License Manager.

- 1. Select .h2h file created on the [Source Computer](#)
- 2. Verify computer names are accurate
- 3. Apply License to [Recipient Computer](#)

Features

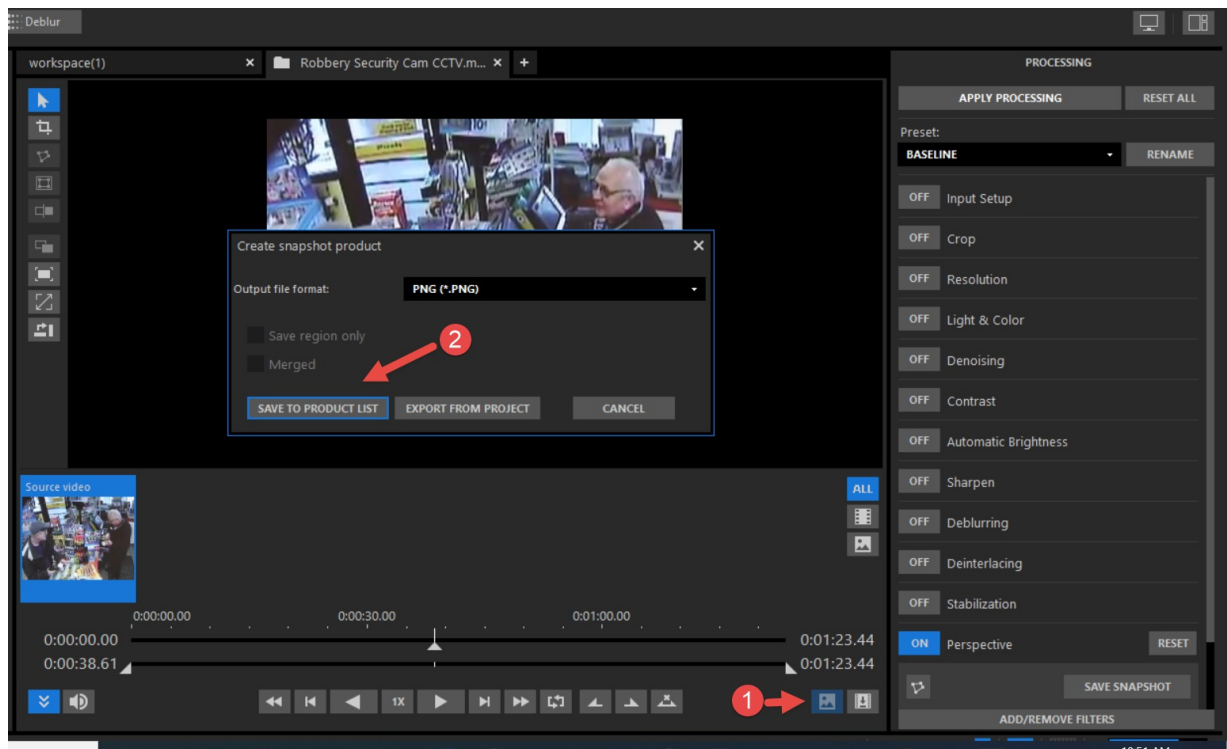

Set as Thumbnail feature

Last updated: 2021-01-05T18:31:07.000Z | [Online Version](#)

A thumbnail is a small representation of an image that is used to identify a file by its contents intended to make it faster to manage a group of larger images.

To create a thumbnail, create a snapshot of the image you would like to be displayed as the thumbnail and click "save to product list".

The image will display in the Product list section as seen below:

Right click on the desired snapshot and choose Set as Thumbnail

Your updated thumbnail will be displayed in the Project Panel.

Compare/Split

Last updated: 2021-01-28T17:26:28.000Z | [Online Version](#)

Use the Compare/Split option to see the Before/After processing view of your video. This feature is helpful to see how your filter options compare to the original.

TIPS:

- You can click and drag the center divider to show more of the Before or After section.

Deblurring Tool

Last updated: 2021-07-03T14:35:22.000Z | [Online Version](#)

The Deblurring Tool is designed to reduce blur artifacts caused by defocus or motion using fewer parameters and multiple outputs.

1. Pause the video and click the Deblur button.

o

2. Deblurring tool interface will launch and automatically calculate estimated values for Lambda Weight and Kernal Size. Make changes based on parameter descriptions below. Click Next

o

3. The Deblurring tool will produce variations on your source image using the provided parameters and display them on the left. Wait for processing to complete and select the best image. If none of the images are acceptable click Show Original to go back and adjust the parameters.

o

4. Click Save when acceptable results are produced.

Parameters

Lambda Weight

Most values are usually between 0-10. Start with the automatically calculated estimate. For lighter images, lambda will usually be lower.

Kernel Size

Start with the automatically calculated estimate. Increase the kernel size if the image is not deblurred enough. Decrease the kernel size if significant artifacts are created.

TIPS:

- Use the Toggle Ringing ON/OFF switch to reduce the ring artifacts created by the deblurring tool during processing

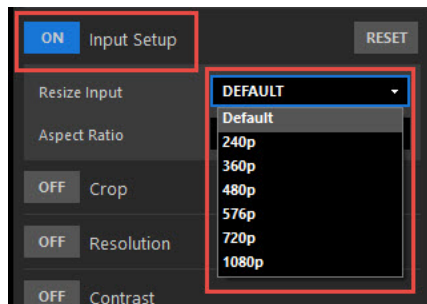

Filters

Input Setup Filter

Last updated: 2021-06-22T17:15:47.000Z | [Online Version](#)

The Input Setup Filter Allows the user to reduce or enlarge the resolution and or aspect ratio of the project file such that the output will match this new resolution or aspect ratio setting.

Resize Input: This setting gives the user options to change the output video resolution, for example the project file's source resolution might be 720p and using the 1080p setting will increase the working and output resolution to 1080p.

Aspect ratio: A proportional relationship between an image's width and height describing an image's shape. Aspect ratios are written as a formula of width to height, like this: **4:3**. This setting allows the user to change the project files working and output aspect ratio.

Perspective Filter

Last updated: 2020-12-10T15:20:18.000Z | [Online Version](#)

Our perspective filter allows arbitrary stretching of part of an image to correct the perspective and includes the ability to leverage our other filters such as our multi-frame super resolution to achieve great results.

In the image below, the perspective filter was used to display a frontal view of an angled license plate in addition to using other filters to receive greater results.

Deinterlacing

Last updated: 2021-01-28T17:24:10.000Z | [Online Version](#)

Some video sources output an interlaced video signal. Each frame is split into odd and even horizontal scan lines called fields which are sampled at different time instances. This effectively results in doubling the frame rate without increasing bandwidth requirements. To eliminate “combing” artifacts which are produced by interlaced frame acquisition, the deinterlacing enhancement should be used.

Low

Low is the fastest and the least accurate. With this setting, deinterlacing is performed by discarding the odd field and upscaling the even field to fit the video's vertical resolution. The processing uses a bicubic interpolation algorithm to upscale the even field.

Medium

Medium is more computationally demanding and produces better results. With this setting, deinterlacing is performed by discarding the odd field and upscaling the even field to fit the video's vertical resolution. The processing uses a more advanced algorithm, known as kernel regression, to upscale the even field. The edge-preserving properties of the kernel regression algorithm is able to handle slant edges better than the bicubic interpolation used by the Low setting.

High

High uses both odd and even fields to perform deinterlacing. If used in combination with Resolution enhancement, this setting instructs Multi-Frame Super-Resolution processing to use both odd and even fields.

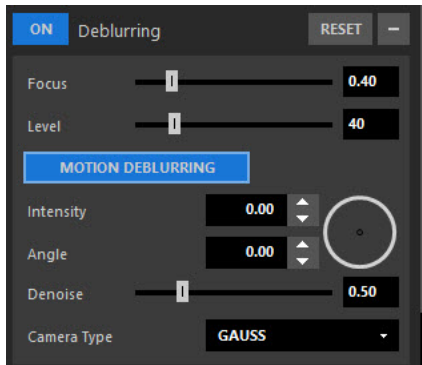

Tips:

1. Low and Medium settings may yield better results for deinterlacing videos showing a scene with non-rigid objects with uneven lines and textures, like people and animals.
2. Using High setting with Resolution enhancement may result in a significant drop in processing bandwidth

Deblurring Filter

Last updated: 2021-06-22T17:15:34.000Z | [Online Version](#)

Deblurring Filter Removes distortion from blurry and noisy artifacts of images caused by defocus aberration or motion blur.

Focus

Higher values will increase the influence of pixels which are far away, thus causing the frame to look blurry for the highest value. Lower values will decrease the influence of pixels which are far away.

Level

You can change the amount of deblurring enhancement by moving this slider from 0 (no change in contrast) to 200 (maximum deblurring enhancement).

Motion Deblurring

Removes the blur associated with linear motion

Intensity

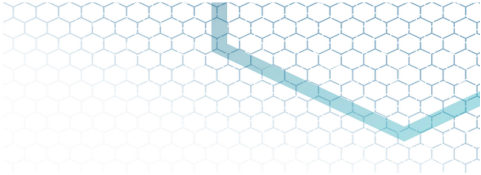

Lower values will have more of a deblurring effect in flat regions, but textured regions will become blurry. Higher values will have less of a deblurring effect in flat regions, but better edge and corner reconstruction in textured regions.

Angle

Directional angle of the blur

Denoise

Tune processing algorithms used to adjust the smoothness (i.e. the amount of noise/texture) of the final reconstructed image.

Disk: Produces a denser middle and gradually fades out moving away from center. Images of unfocused lights have sharply defined edges whereby the convolution kernel, or Point Spread Function (PSF) is disk shaped.

Camera Type

Gauss: Produced by convolving the image with a convolution kernel following a discrete approximation to a Gaussian distribution with normalized area. The operation is popular because it can be done relatively quickly due to fact that the two dimensional convolution is separable into horizontal and vertical one dimensional convolutions.

Crop

Last updated: 2021-01-28T17:28:50.000Z | [Online Version](#)

Video can be cropped to desired dimensions by using Crop enhancement. The amount of crop can be specified by setting the percentage of video size or by specifying each crop border independently. Your preferred method can be chosen with the Custom Crop button. To assist cropping, Forensic displays cropping guidelines that are visible only if Apply Enhancements button is turned off. You can also manually adjust these using the cropping mouse mode button on the upper left of the workspace.

Resolution

Last updated: 2021-05-25T14:50:36.000Z | [Online Version](#)

The Resolution Enhancement tab is used to control the Multi-Frame Super-Resolution processing. It provides an effective means for increasing the native video resolution by utilizing information redundancy between successive frames in a video.

Applications and benefits include:

- noise reduction
- suppression of atmospheric distortions (mirage-like wobbling)
- reduction of compression blocking artifacts

Resolution Filter - Compact

Resolution Filter - Expanded

Frames

This slider controls the number of successive frames used by the algorithm. The maximal number of frames can be set by going to Tools > Options > Processing > Cache Size

Super Resolution

This combo box is used to set the upscale factor applied to the input frame by the Multi-Frame Super-Resolution algorithm. Available options depend on the input resolution and can be 1x, 2x, 3x, or 4x.

For example, applying a Super-Resolution factor of 2x to an input video with a resolution of 320x240 results in a video with a resolution of 640x480.

Fusion

This slider controls the suppression of outlier-related processing artifacts. The first phase of the Super-Resolution algorithm is motion estimation between successive frames. However, this can generate ghosting artifacts in some cases. The Fusion parameter can reduce ghosting

Accuracy

This slider can be used to control the tradeoff between sharpness and noise suppression. Settings range from 0 (maximum noise suppression) to 1 (maximum sharpness)

ROI Mode

This button allows the user to enhance, preview, and save the ROI with a wider range of Super-Resolution (upscale) factors.

NOTE: The maximum output video size is 1080p. Hence higher resolution video has a lower available Super-Resolution factor. However, a larger Super-Resolution factor can be set by limiting the video with ROI mode or cropping the video.

Tips:

1. To enhance the precision of the motion estimation, select an ROI which doesn't contain outliers.
2. Choosing the appropriate Frames value can be challenging. The optimal value depends on the desired performance, Super-Resolution upscale factor, and scene dynamics. For static scenes, the best results are achieved by setting the Frames value to 9 or higher and the Super Resolution set to 2x.
3. With dynamic scenes, it's best to start at the lowest setting and work your way up. With static scenes, it's best to start high and work your way down.
4. Super Resolution yields the best results for static scenes when used in conjunction with Deblurring.

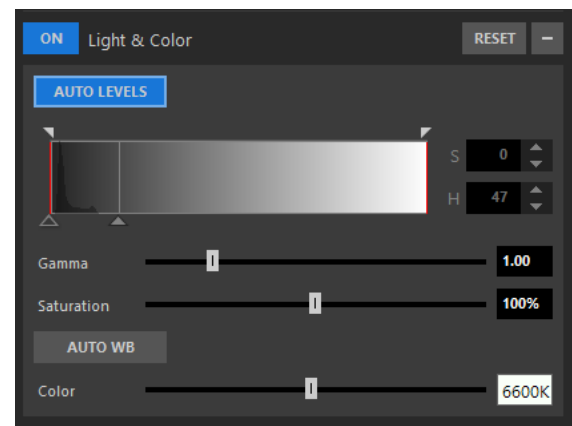

Light & Color

Last updated: 2021-01-28T17:39:52.000Z | [Online Version](#)

The Light & Color enhancement makes it possible to reduce the effects of extreme color and light changes on image quality.

Light & Color - Compact

Light & Color - Expanded

Auto Levels

This button auto-adjusts the lighting levels of the video. For manual adjustments use the Shadows and Highlights sliders.

Gamma

This slider controls the "gamma correction". The value of "1.00" means that the input and output frames are identical in terms of "gamma correction".

Saturation

This slider controls the color saturation. 100% means that the saturation remains unchanged.

Auto White Balance

This button turns auto-adjustment of the "white balance" ON/OFF. For manual adjustments use the "Color" slider.

Automatic Brightness

Last updated: 2021-01-28T17:44:20.000Z | [Online Version](#)

The automatic brightness filter is designed to adjust to dynamic brightness changes in your video using a unique implementation of MotionDSP's dehazing algorithm. Automatic Brightness is able to enhance in real-time with accuracy.

Automatic Brightness - Compact

Automatic Brightness - Expanded

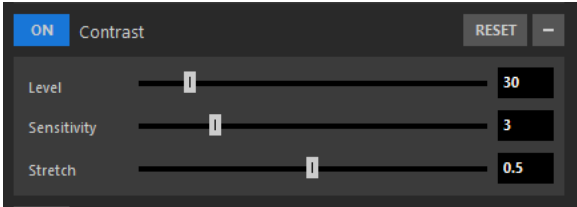

Strength	The level of brightness to be applied.
Radius	Defines locality of the algorithm (impact of neighbor pixels). This is a Radius for The Median Filter.
Quality	Determines level of sub-sampling of the input frame, i.e., it tells by how much the input frame is reduced and then processed: low means 4 times per each dimension medium is twice for each dimension high does not reduce it at all

Contrast

Last updated: 2021-01-28T17:24:20.000Z | [Online Version](#)

The type of sensor and lighting conditions both impact video fidelity. In either case, the quality of the video can be improved by adjusting the lighting in the video. Forensic has an advanced algorithm for contrast-limited adaptive histogram equalization.

This process uses algorithms for automatic contrast adjustments in a single frame and across multiple frames to simulate the effect of a longer exposure time. This has the effect of both suppressing noise and revealing new detail within the image/video.

	
Contrast - Compact	Contrast - Expanded

Level	You can change the amount of contrast enhancement by moving this slider from 0 (no change in contrast) to 200 (maximum contrast enhancement). The default value for this parameter is 30.
Sensitivity	When the Sensitivity level is set at 1, the contrast enhancement is applied to the entire frame as a whole. Higher settings enable the processing algorithm to work on smaller regions in a frame. For example, at a setting of 5, the contrast enhancement is applied to the individual histograms in each of the 25 regions within a transparent 5x5 grid within the image.
Stretch	This parameter defines how much to stretch the processing algorithm for significant contrast variations in the image. A larger Stretch is good for resolving details in the shadows. A lower Stretch works better for relatively even light distribution. The range for the stretch parameter is [0-1].

Denoising

Last updated: 2021-01-28T17:23:51.000Z | [Online Version](#)

The Denoising enhancement panel allows you to tune processing algorithms used to adjust the smoothness (i.e. the amount of noise/texture) of the final reconstructed image.

	
Denoising - Compact	Denoising - Expanded

Intensity	Lower values will have more of a denoising effect in flat regions, but textured regions will become blurry. Higher values will have less of a denoising effect in flat regions, but better edge and corner reconstruction in textured regions.
Focus	Higher values will increase the influence of pixels which are far away, thus causing the frame to look blurry for the highest value. Lower values will decrease the influence of pixels which are far away.
Scale	This parameter is used to upscale the image resolution, similar to the Super Resolution parameter in the Resolution filter. Available options depend on the input resolution and can be 1x, 2x, 3x, or 4x. For example, applying a Scale factor of 2x to an input video with a resolution of 320x240 results in a video with a resolution of 640x480.

Sharpen

Last updated: 2021-01-28T17:24:01.000Z | [Online Version](#)

This enhancement uses Unsharp Masking, a well-known filter in image processing. It emphasizes the contrast of small details (edges of objects) in the video frame.

ON Sharpen

RESET +

Intensity 20

Sharpen - Compact

ON Sharpen

RESET -

Intensity 20

Focus 1.00

Sharpen - Expanded

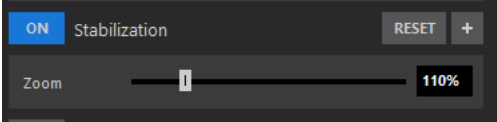

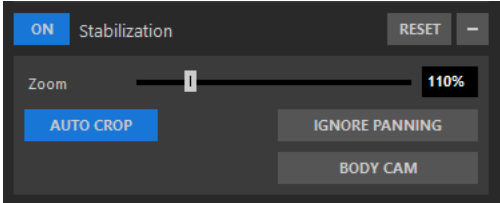

Intensity	Defines how much the edges will be pronounced on a processed image.
Focus	Defines the radius of the unsharp masking algorithm in pixels.

NOTE: This filter does not add any information to the image, as is the case with super resolution or deblurring filters.

Stabilization

Last updated: 2021-01-28T17:28:40.000Z | [Online Version](#)

The Stabilization enhancement panel allows you to tune the algorithms used to reduce shaking and unwanted movement in the video

	
Stabilization - Compact	Stabilization - Expanded

Zoom	Increasing this parameter zooms in on the video frame content, effectively hiding black borders.
Auto Crop	Turning this option on will suppress black borders, but as a consequence may reduce the effect of stabilization.
Ignore Panning	This button optimizes the stabilization function during extreme panning motions or when the platform's sensor is panning for an extended period of time.
Body Cam	This button optimizes for the stabilization of low-frequency shake such as that of a body cam

TIPS:

1. For the best possible stabilization, turn off Auto Crop. If the black borders are distracting increase the Zoom level. Frames will be zoomed in and stabilization quality will be retained.
2. When the most important priority is to exclude black border pixels, turn on Auto Crop. If the stabilization quality is poor, increase the Zoom level.

Region of Interest

Last updated: 2021-01-28T17:28:30.000Z | [Online Version](#)

Forensic has the option to process only a selected area--or "region of interest" (ROI)--of the original video. This is useful to improve processing speed, and can also allow the enhancement algorithms to generate better results in a limited area when the video frame contains significant light and color variations.

The ROI can be moved and resized using the corners when the ROI tool is selected. For more accurate control use the options available in the ROI filter

Left - Top left corner pixel location on the X-axis

Top - Top left corner pixel location on the Y-axis

Width - Total width of the ROI

Height - Total height of the ROI

False Color

Last updated: 2021-01-28T17:28:21.000Z | [Online Version](#)

False Color can be used to change the color palette of the video display. Under some viewing conditions this may result in better perception of fine details.

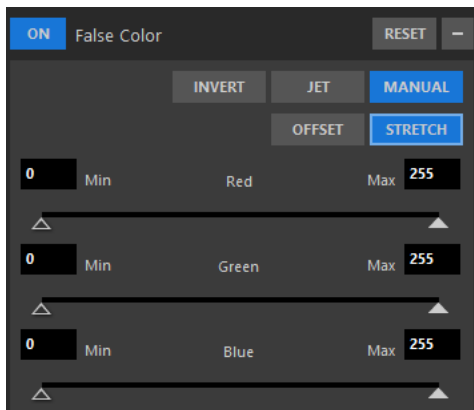

- **Invert** - Substitutes colors with their complements. Used on IR feeds, this mode effectively switches between “Black-Hot” and “White-Hot” output.

- **Jet** - Uses video luma component and represents it as a Jet false color map. As a result, variations in luminance - contrast are translated into color hue variations.

- **Manual Offset** - Adds the offset to each RGB component and clips the values to 0 - 255. You set the offset via the slider. Offset range = [-255, 255], default offset is 0.

- **Manual Stretch** - Adds the offset and scales to each RGB component. You set the Minimum Clip Value and the Maximum Clip Value, similar to the Light & Color manual mode. The clip range = [0, 255], the default Minimum Clip Value is 0; the default Maximum Clip Value is 255.

Radial Distortion

Last updated: 2021-01-28T17:28:12.000Z | [Online Version](#)

This enhancement simplifies the process of correcting optical distortion caused by a camera lens.

There are two modes for this filter. Manual mode allows you to make adjustments to improve the image when the camera type is not known. The Camera Presets mode allows you to automatically apply the filter for commonly known commercial camera types.

Manual Mode

ON

Radial Distortion

RESET

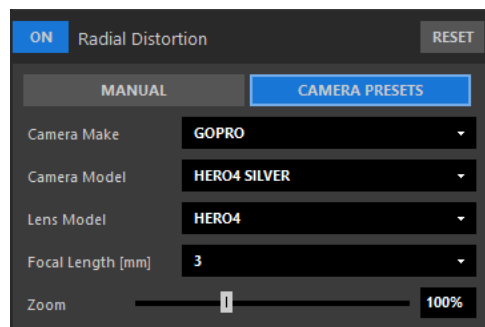

MANUAL

CAMERA PRESETS

Main	<div></div>	-55
Edge	<div></div>	12
X Shift	<div></div>	-11
Y Shift	<div></div>	-2
Zoom	<div></div>	100%

Main	Specifies the amount of spherical correction that may be introduced. Positive values make the image convex while negative ones make it concave. The whole effect is similar to wrapping the image inside or outside a sphere.
Edge	Specifies the amount of additional spherical correction at image edges.
X Shift, Y Shift	These two options specify the shift of the image produced by not perfectly centered pairs of lenses. This option produces visible results only if the Main or Edge options are non zero.
Zoom	Specifies the amount of the image enlargement or reduction caused by the hypothetical lens.

Camera Presets Mode

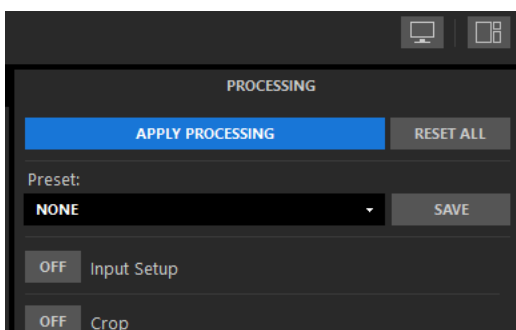

This mode enables you to quickly select presets for correcting potential radial distortion effects caused by a specific lens. In order to correct the potential lens distortion, you need to know the camera make & model and/or the lens model & focal length.

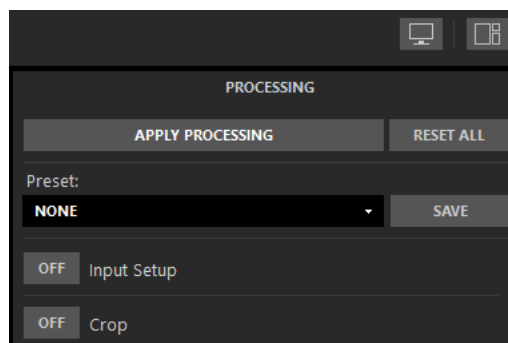

Apply Processing

Last updated: 2021-01-28T17:27:09.000Z | [Online Version](#)

Click the Apply Enhancements button on the top to view the enhanced results of the video opened in the selected Workspace “on-the-fly” as you adjust enhancement settings. (Your original video file will never be modified.)

Apply Processing - Enabled

Apply Processing - Disabled

NOTE: Applying enhancements “on-the-fly” requires more processing power, so—depending on the responsiveness of your system—you may prefer to leave Apply Enhancements ‘ON’ at all times, or you may prefer to only periodically toggle Apply Enhancements when you want to view the enhancement results.

Getting the best results with Forensic

Last updated: 2021-01-28T17:40:16.000Z | [Online Version](#)

Video enhancement is generally more effective on a clean video source. Ideally, users should import a video in its natively-captured format - that is, the file as it was transferred right from the camera or sensor.

A video that has been transcoded (i.e., had its format changed from one format to another, e.g., from FLV to MOV) loses many of its high-frequency details and is more difficult to enhance. A video that has had its frame rate changed (e.g., a video that has had its original frame rate of 7 frames per second changed to 15 frames per second by frame-rate doubling) is also difficult to enhance since duplicate video frames can cause problems with frame analysis.

Forensic can still produce impressive results with videos that have been transcoded or have had their frame rates modified, but enhancing a clean source will produce optimum results.

Workflow

Spotlighting

Last updated: 2021-01-28T17:25:41.000Z | [Online Version](#)

There are three ways to spotlight an individual or object in your video:

1. Use the ellipse or rectangle object and choose a *Border* area type

o

2. Enable the background layer to darken, block, or blur the entire video. Then, use an ellipse or rectangle object and the *No Change* or *Border* area type to make the area inside the ellipse or rectangle object visible.

o

3. Create an ellipse or rectangle object and select *No Change*. Under the *Layer Options*, select either *Arrow* or *Text* to annotate the ellipse or rectangle object.

o

TIPS: When using an object with a *No Change* area type, the border displaying the boundaries of the object will not be visible when saved or exported. To see your project as it will be exported select **Lock Object Editing** under **Spotlight Tools**. If you would like a border, use the *Border* area type.

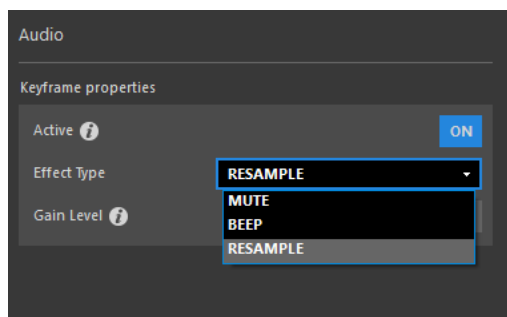

Audio Redaction

Last updated: 2021-01-28T17:24:42.000Z | [Online Version](#)

Begin the audio redaction process by navigating to the section of the video where you would like the audio redaction to begin. Click the keyframe button on the left side of **Audio** layer.

Keyframe properties are displayed in the **Tools Panel** on the right side of the screen.

Mute is the default selection. Choose **Resample** effect type to alter the audio or **Beep** to insert a loud beeping sound over the audio.

Play the video and add the second keyframe to mark the end of the **Audio Redaction** section.

Play the video and listen carefully for audio that should be redacted. Add new keyframes before and after each time that audio is present in the video.

NOTE: Audio redactions are not reversible. “Mute” completely removes the audio in the given section. “Beep” completely overwrites the audio through the beep signal in the given section. “Resample” distorts frequencies of the audio which changes the pitch randomly, not with a predefined value, so the audio cannot be reversed to its original state.

Video Redaction

Last updated: 2021-01-28T17:30:03.000Z | [Online Version](#)

In the **Workspace Panel** in the center of the screen, the video will be displayed. To begin the redaction process, select the ellipse or rectangle masking element to mark the object to be redacted.

Draw either an ellipse or a rectangle around the object to be redacted. Spotlight automatically creates the object layer and adds a keyframe, displayed at the bottom of the screen.

Spotlight also creates a generic name for the object layer. It is good practice to rename the layer at this point and assign a more intuitive name, like "Driver's face", instead of the generic name of "Ellipse.2".

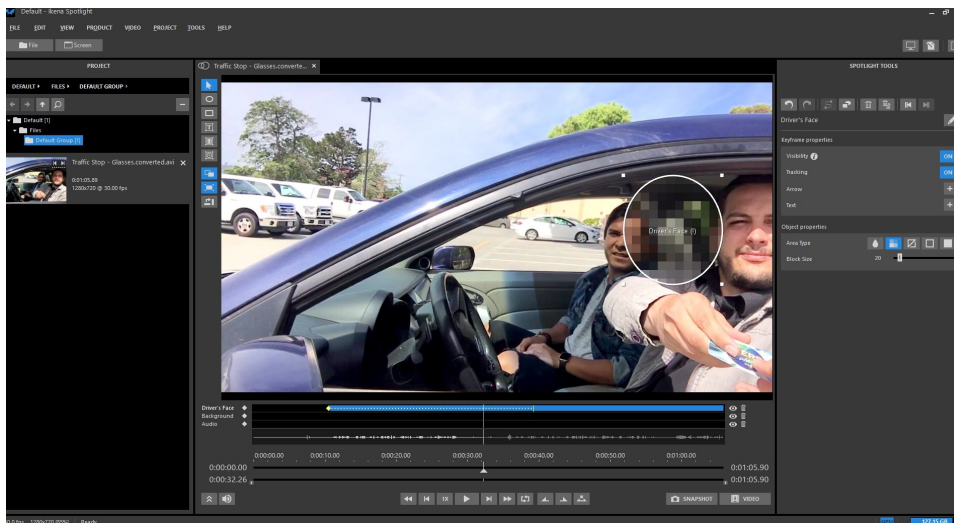

NOTE: This layer name label is only to assist the editing process and will not appear in the final exported video product.

Spotlight starts tracking the object automatically. The tracking is represented by a yellow dotted line appearing after the first keyframe. The tracking is performed seven (7) seconds forward from the current seeker position.

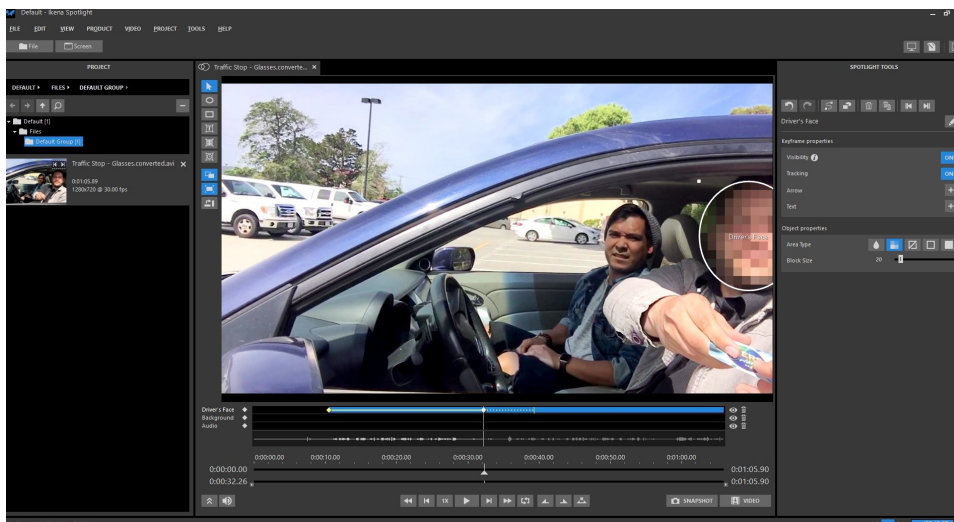

Tracking "Ghost" is the distance from current seeker position. Play the video and notice that the tracking is chasing the Ghost.

If the tracker path requires adjustment, simply drag the ellipse or rectangle to correct the tracker path as necessary.

Spotlight automatically adds a keyframe and completes the tracking. You will note that the question mark sign disappears from the object name in the player as the tracking is now complete.

Repeat the redaction process for more objects, but note that Spotlight can track only three (3) objects *simultaneously*. You can redact more than three objects in your video but not all objects will be tracked at the same time.

In the example below, we are redacting the driver's face, the driver's license, and the passenger's face. All three objects will be tracked simultaneously.

By using the **Tools Panel** on the right side of the application window, you can change the video masking element properties. Options include blur, block and solid color. To prevent a redaction from being reversed, we recommend using the solid color option to redact faces and objects. The **solid color option** permanently changes the pixel values in the redacted area. For example, the driver's license is masked by the solid blue color set in the video masking element properties panel on the right side of the screen.

For objects that appear briefly in the scene, we recommend using the **Keyframe Visibility** feature. In our example, we drew the rectangle around the driver's license at the moment it entered the scene and added another keyframe at the point when it is no longer visible. We then clicked the second keyframe and turned off visibility in **Keyframe** properties in the **Tools Panel**. **Keyframe Visibility** can be turned on if the object reappears.

TIP: Do not create a new object layer for an object that reappears later in the video. Just create a new keyframe in the original layer and visibility will be automatically turn on.

Features

Objects

Last updated: 2021-01-28T17:25:19.000Z | [Online Version](#)

Video Masking Elements (Objects) include **Ellipse** and **Rectangle**. These can be used to blur, darken, or scramble individuals or objects in the video. A label such as a caption or an arrow can be attached to the selected video masking element. The label will move with the element.

Toolbar

Last updated: 2021-01-28T17:40:36.000Z | [Online Version](#)

1. Select Tool	Tool for selecting and manipulating objects
2. Ellipse Tool	Create an elliptical object
3. Rectangle Tool	Create a rectangular object
4. Text Tool	Create a text annotation object
5. Video-Time Tool	Create an annotation that displays the video's timecode
6. Real-Time Tool	Create an annotation that displays the real video time
7. Compare (Switch)	Enable/Disable layer visibility
8. Fit to Window	Zoom the video to fit inside the player
9. Rotate	Rotate the video 90 degrees clockwise

Layers

Last updated: 2021-01-28T17:25:58.000Z | [Online Version](#)

The layer hierarchy panel shows all objects/annotations. Spotlight features four types of layers – object, annotation, background, and audio:

1. There is an object layer for each rectangle or ellipse object.
2. Annotations are text or time overlays you can add to any segment of the video.
3. The Background layer is present in every video. It includes everything that hasn't been identified as an object to be redacted.
4. The Audio layer is present if the video includes audio. An audio waveform is shown below the Audio layer to highlight the sections of the video where audio is present.

Every layer has a specific color. Objects layers are blue, annotation layers are yellow, the background layer is brown, and the audio layer color will depend on the redaction type.

There are several operations that can be performed with layers:

- **Add Keyframe to the Layer** - select the 'diamond' icon on the left side of the layer, in order to add a new keyframe to the layer
- **Drag & Drop Layer Reordering** - hover the mouse over the layer name area and you will notice a hand tool. Drag the layer and move it to another position.
- **Rename Layer** - double-click on the layer name in the Layers panel or select the Edit button next to the layer name in the tools properties panel in order to rename the layer.
- **Hide Layer** - click the 'eye' icon on the right side of the layer in order to hide or show the layer. Hidden layers won't appear either in the live preview or in the exported video product.
- **Delete Layer** - click the 'trash' icon on the right side of the layer (next to Hide/Show layer button) in order to delete the layer. The audio and background layer cannot be deleted but this action will delete all the keyframes from these layers.

TIPS: Spotlight will not display an audio layer if the workstation does not have an active sound output device

Automatic Face Suggestions

Last updated: 2021-01-28T17:26:36.000Z | [Online Version](#)

When a video is loaded into the Spotlight player in a paused state, Automatic Face Suggestions will run. Automatic Face Suggestions will search the frame for faces and draw a bounding box around the face making it as easy as selecting the box to begin the redaction and tracking process.

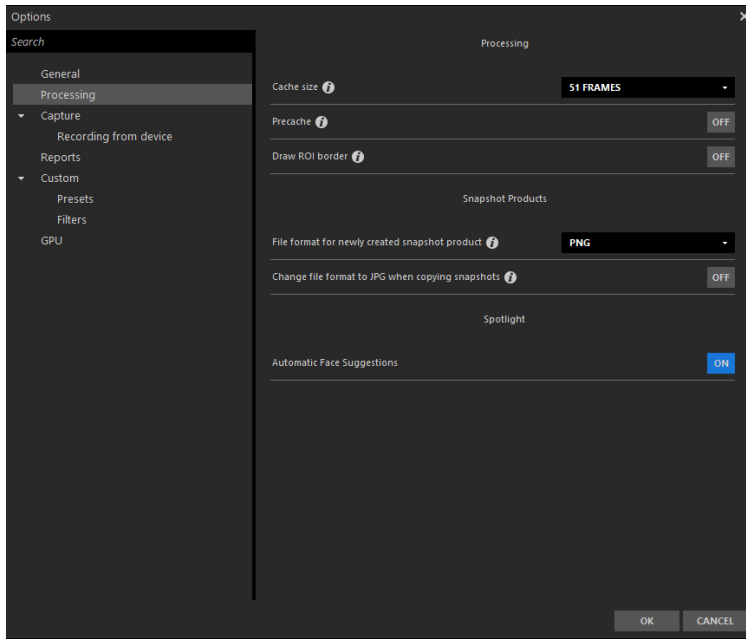

Automatic Face Suggestions - Select a bounding box to create redaction object

TIPS:

- You can disable Automatic Face Suggestions from the Tools>Options processing menu

Multi-Channel Audio

Last updated: 2021-01-28T17:38:35.000Z | [Online Version](#)

Multi-channel audio is common in a video with sound and each channel is displayed with its own layer in Spotlight. Video with only one channel is called mono. Video with two channels is most often stereo audio, one channel for the left microphone and one channel for the right microphone.

The example track above is multi-channel audio but it is *NOT* stereo audio. The audio in this dashcam video comes from two different sources. The first source, *Audio 1*, is the audio captured from the dashcam. *Audio 0* is from the radio feed.

You can redact the audio from both tracks simultaneously or individually based on your configuration and requirements.

Spotlight User Interface Overview

Last updated: 2021-01-28T17:26:50.000Z | [Online Version](#)

There are three main panels in Spotlight.

1. **The Project Panel** on the left allows you to select the video to load into the Workspace player.
2. **The Workspace Panel** in the middle allows you to generate and move overlay elements and set keyframes. The Workspace Panel contains: Mouse toolbar, Layer panel, and Player
3. **The Tools Panel** on the right allows you to change the properties of the overlay elements.

The panel layout can be customized around using the *View > Layout* selection from the menu. This can be useful for making more room for the **Workspace** and **Tools** panels when you are only working on a single video.

Spotlight Tools

Features

Last updated: 2021-04-20T03:01:23.000Z | [Online Version](#)

1. Undo	-Undo previous interaction
2. Redo	-Redo previous undo
3. Lock Object Editing	-Lock changes to all layers (shows image as it will be exported, no UI elements such as layer names and object boundaries)
4. Delete Keyframe	-Delete the keyframe the playhead is on from the selected layer
5. Delete All Layers	-Delete all layers from the selected video
6. Previous Keyframe	-Go to the previous keyframe of the selected layer
7. Next Keyframe	-Go to the next keyframe of the selected layer
8. Toggle Lock Audio	<p>-Disabled: Edit audio channels together (Useful for normal Stereo and Mono Audio)</p> <p>-Enabled: Edit audio channels individually (Useful for audio with multiple sources mapped to individual channels)</p>
9. Rename	-Rename the selected layer (Currently displayed as <i>Ellipse.6</i>)
10. Face Suggestion	-When you turn the face suggestion setting on, human faces will be detected in a digital image or video, allowing you to automatically generate a redaction object based on that detection

Tracking

Last updated: 2021-01-28T17:37:40.000Z | [Online Version](#)

Tracking is automatically started whenever a new ellipse or rectangle object is created.

1. Solid Line - Object motion path between keyframes is saved
2. Dotted Line - Temporary tracking that requires a keyframe to save.
3. Tracking Progress Indicator - Tracking will only calculate 7 seconds ahead of the playhead per object as illustrated by the Tracking Progress Indicator

- Create keyframes by clicking the keyframe button on the left, next to the layer name
 - A keyframe is created whenever an object is manually adjusted
 - The object's motion path must be recalculated whenever a new keyframe is placed.
 - Tracking can be disabled for individual layers via the Spotlight Tools menu.
 - The maximum number of objects that can be tracked simultaneously is three
-

Visibility

Last updated: 2021-01-28T17:25:49.000Z | [Online Version](#)

For objects that appear briefly in the scene of a video, we recommend using the **Keyframe Visibility** feature. In our example, we drew the rectangle around the driver's license at the moment it entered the scene and added another keyframe at the point when it is no longer visible. We then clicked the second keyframe and turned off visibility in **Keyframe** properties in the **Tools Panel**. **Keyframe Visibility** can be turned on if the object reappears.

TIP: Do not create a new object layer for an object that reappears later in the video. Just create a new keyframe in the original layer and visibility will be automatically turn on.

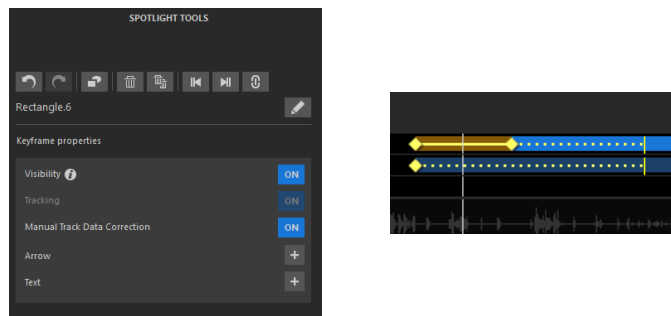

Manual Track Data Correction

Last updated: 2021-01-28T17:39:02.000Z | [Online Version](#)

In certain scenes when automated tracking is not adequate or motion is unreasonable, Manual Track Data Correction can allow you to make precise changes to the motion path of individual objects. To begin, Manual Track Data Correction must first have an object that has been tracked between two keyframes.

1. With the playhead between two keyframes and the desired object layer selected, navigate to Spotlight tools and select Manual Track Data Correction
 - o

2. Step through the desired range frame-by-frame and adjust the object as necessary.
3. When finished, disable Manual Track Data Correction and review changes

TIPS:

- Tracking status must be completed (solid line), Manual Track Data Correction cannot be completed on tracking that is in progress (dotted line)

Arrow

Last updated: 2021-01-28T17:25:08.000Z | [Online Version](#)

A label such as a caption or an arrow can be attached to a selected video masking element. An arrow can be used to emphasize or highlight an object in the video.
